Foreword

Over my 20 years in computer networking, I have been lucky to work on a handful of popular, large-scale systems. If you had asked me in 2001, I would have told you my favorite project was AOL Instant Messenger. To scale to the size that we did in the early days, we had to create our own APIs for provisioning, security, and control over all aspects of the service—all aspects save the physical network, that is. This was a pain, but we lived with it as compute and storage needs were dynamic while network needs stayed reasonably static. In 2010, while working on what would become Microsoft Azure, it was clear that usage patterns have changed. Compute and storage have now been disaggregated, so it is more important than ever to have non-blocking connectivity and the ability to utilize any overlay technology required by the workload.

Within the last few years, we have seen quite a shift in thinking, from network device vendors adding APIs and Python scripting environments to their devices in the hope of them being driven programmatically. In this book, Eric Chou helps us gain a thorough understanding of interfacing with networks and network devices using Python, from interacting with a single device to large numbers of devices with complex automation using Ansible. Then, he takes us to my favorite topics of network monitoring and security, as well as an array of OpenFlow projects controlled through the Python-based Ryu SDN controller.

Eric and I worked together at Microsoft, where we built Microsoft DEMon, an Openflow-based network packet broker. Eric's deep understanding of Python and his love for automation show in every project we work on together. I have had the pleasure to see many of Eric's examples from this book used in real life and proven in actual projects. In Mastering Python Networking, Eric is adding some theory and a set of practical examples taken from real problems that he has solved.

Rich Groves

Director of R&D at A10 Networks
About the Author

Eric Chou is a seasoned technologist with over 16 years of experience. He has managed some of the largest networks in the industry while working at Amazon and Microsoft and is passionate about network automation and Python. He shares this deep interest in these fields through his teachings as a Python instructor, blogger, and active contributor to some of the popular Python open source projects. Currently, Eric holds two patents in IP Telephony and is a principal engineer at A10 Networks with a focus on product research and development in the field of security.

I would like to thank members of the Packt Publishing team--Meeta Rajani, Prashant Chaudhari, and Sweeny Dias--and my technical reviewer, Allen Su, for making my dream of writing this book a reality. Thank you for the opportunity to work with you and for your tireless effort and support.

I would also like to thank the open source and Python community members for generously sharing their knowledge and code with the public. Without their contributions, many of the projects referenced in this book would not have been possible.

I’m also grateful for the people who have helped me in my career and shaped my professional path. I’d like to thank all who have been part of my professional growth, especially my mentors at each stage of my career: Hup Chen, Monika Machado, and Rich Groves. Thank you for inspiring me to be the best I can be.

Finally, I would like to thank my wife and my two beautiful daughters for their support. They provided me the freedom and understanding I needed to focus on and complete the book.
About the Reviewer

**Allen Su**, CCIE no. 13871 (Routing and Switching, Service Provider, Security), is currently a senior network and cloud security engineer at Microsoft, where he is driving innovative design and engineering of secure edge services and automation capabilities.

Allen is a networking industry veteran, having spent the last 15 years in various engineering and architectural roles. Prior to Microsoft, Allen was at Arista Networks, where he worked with and helped some marquee cloud providers build their cloud-scale networks and define and develop their network automation framework and strategy. Before his tenure at Arista, Allen spent a significant portion of his career at Cisco, learning the intricacies of networking, which he leveraged to design, architect, and build some of the world's largest networks.

*I would like to thank Eric Chou for giving me the opportunity and privilege to review his hard work. It was a great learning journey for me personally, and I think I've gained way more from this journey than what I could give. Eric is the one who inspired me to begin into the network automation journey five years ago, and he continues to be an inspiration for me in this regard.*

*I would also like to thank my wife, Cindy, for the support and love she has always given me, no matter what I set out to do. It would have been a lot tougher to review this book without her support and understanding.*
www.PacktPub.com

Did you know that Packt offers eBook versions of every book published, with PDF and ePub files available? You can upgrade to the eBook version at www.PacktPub.com and as a print book customer, you are entitled to a discount on the eBook copy. Get in touch with us at service@packtpub.com for more details.

At www.PacktPub.com, you can also read a collection of free technical articles, sign up for a range of free newsletters and receive exclusive discounts and offers on Packt books and eBooks.

https://www.packtpub.com/mapt

Get the most in-demand software skills with Mapt. Mapt gives you full access to all Packt books and video courses, as well as industry-leading tools to help you plan your personal development and advance your career.
Why subscribe?

- Fully searchable across every book published by Packt
- Copy and paste, print, and bookmark content
- On demand and accessible via a web browser
Customer Feedback

Thanks for purchasing this Packt book. At Packt, quality is at the heart of our editorial process. To help us improve, please leave us an honest review on this book's Amazon page at https://www.amazon.com/dp/1784397008.

If you'd like to join our team of regular reviewers, you can e-mail us at customerreviews@packtpub.com. We award our regular reviewers with free eBooks and videos in exchange for their valuable feedback. Help us be relentless in improving our products!
# Table of Contents

**Preface**
- What this book covers
- What you need for this book
- Who this book is for
- Conventions
- Reader feedback
- Customer support
  - Downloading the example code
  - Downloading the color images of this book
- Errata
- Piracy
- Questions

1. **Review of TCP/IP Protocol Suite and Python Language**
   - The internet overview
     - Servers, hosts, and network components
     - The rise of datacenter
       - Enterprise datacenters
       - Cloud datacenters
       - Edge datacenters
   - The OSI model
   - Client server models
   - Network protocol suites
     - The Transmission Control Protocol (TCP)
       - Functions and Characteristics of TCP
       - TCP messages and data transfer
     - User Datagram Protocol (UDP)
     - The Internet Protocol (IP)
       - The IP NAT and security
       - IP routing concepts
   - Python language overview
     - Python versions
     - Operating system
     - Running a Python program
     - Python built-In types
       - The None type
       - Numerics
       - Sequences
       - Mapping
       - Sets
     - Python operators
     - Python control flow tools
     - Python functions
     - Python classes
     - Python modules and packages
   - Summary

2. **Low-Level Network Device Interactions**
The challenges of CLI
Constructing a virtual lab
Cisco Virtual Internet Routing Lab (VIRL)
VIRL tips
Cisco DevNet and dCloud
GNS3
Python Pexpect Library
Installation
The Pexpect overview
Our first Expect program
More Pexpect features
Pexpect and SSH
Putting things together for Pexpect
The Python Paramiko library
Installing Paramiko
The Paramiko overview
Our first Paramiko program
More Paramiko features
Paramiko for Servers
Putting things together for Paramiko
Looking ahead
Downsides of Pexpect and Paramiko compared to other tools
  Idempotent network device interaction
  Bad automation speeds bad things up
Summary

3. API and Intent-Driven Networking
Infrastructure as the Python code
  Screen scraping versus API structured output
  Data modeling for infrastructure as code
The Cisco API and ACI
Cisco NX-API
  Lab Software Installation and Device Preparation
  NX-API examples
Cisco and YANG model
The Cisco ACI
The Python API for Juniper networks
Juniper and NETCONF
  Device Preparation
  Juniper NETCONF examples
Juniper PyEZ for developers
  Installation and preparation
  PyEZ examples
The Arista Python API
The Arista eAPI management
  The eAPI preparation
eAPI examples
The Arista Pyeapi library
  The Pyeapi installation
  Pyeapi examples
Vendor neutral libraries
Summary
4. The Python Automation Framework - Ansible Basics
   A quick Ansible example
   - The control node installation
   - Your first Ansible playbook
     - The Public key authorization
     - The inventory file
   - Our first playbook
   - The advantages of Ansible
     - Agentless
     - Idempotent
     - Simple and extensible
   - The vendor Support
   - The Ansible architecture
     - YAML
     - Inventories
     - Variables
     - Templates with Jinja2
   - Ansible networking modules
     - Local connections and facts
     - Provider arguments
   - The Ansible Cisco example
   - The Ansible Juniper example
   - The Ansible Arista example
   - Summary

5. The Python Automation Framework - Ansible Advance Topics
   - Ansible conditionals
     - The when clause
     - Network module conditional
   - Ansible loops
     - Standard loops
     - Looping over dictionaries
   - Templates
     - The Jinja2 template
     - Jinja2 loops
     - The Jinja2 conditional
   - Group and host variables
     - Group variables
     - Host variables
   - The Ansible vault
   - The Ansible include and roles
     - The Ansible include statement
   - Ansible roles
   - Writing your own custom module
     - The first custom module
     - The second custom module
   - Summary

6. Network Security with Python
   - The lab setup
   - Python Scapy
     - Installing Scapy
Interactive examples
Sniffing
The TCP port scan
The ping collection
Common attacks
Scapy resources
Access lists
Implementing access lists with Ansible
MAC access lists
The syslog search
Searching with regular expressions
Other tools
Private VLANs
UFW with Python

Summary
7. Network Monitoring with Python - Part 1
Lab setup
SNMP
Setup
PySNMP
Python visualization
Matplotlib
  Installation
  Matplotlib - the first example
  Matplotlib for SNMP results
  Additional Matplotlib resources
Pygal
  Installation
  Pygal - the first example
  Pygal for SNMP results
  Additional Pygal resources
Python for Cacti
  Installation
  Python script as an input source

Summary
8. Network Monitoring with Python - Part 2
Graphviz
Lab setup
Installation
Graphviz examples
Python with Graphviz examples
LLDP neighbor graphing
  Information retrieval
  Python parser script
  Final playbook
Flow-based monitoring
NetFlow parsing with Python
  Python socket and struct
ntop traffic monitoring
  Python extension for ntop
sFlow
SFlowtool and sFlow-RT with Python
Elasticsearch (ELK stack)
Setting up a hosted ELK service
The logstash format
Python helper script for Logstash formatting

Summary

9. Building Network Web Services with Python
Comparing Python web frameworks
Flask and lab setup
Introduction to Flask
The HTTPie client
URL routing
URL variables
URL generation
The jsonify return
Network s API
Flask-SQLAlchemy
Network content API
Devices API
The device ID API
Network dynamic operations
Asynchronous operations
Security
Additional resources
Summary

10. OpenFlow Basics
Lab setup
Introducing OpenFlow
Basic operations
OpenFlow 1.0 vs 1.3
Mininet
The Ryu controller with Python
Open vSwitch commands
The Ryu firewall application
Layer 2 OpenFlow switch
Planning your application
Application components
The POX controller
Summary

11. Advanced OpenFlow Topics
Setup
OpenFlow operations with Ryu
Packet inspection
Static router
Mininet topology
Ryu controller code
Ryu flow installation
Ryu packet generation
Final result
Router with API
  Ryu controller with API
  API usage examples
BGP router with OpenFlow
  Lab router setup
  Python with the BGP speaker library
  Ryu BGP application
Firewall with OpenFlow

Summary

12. OpenStack, OpenDaylight, and NFV
   OpenStack
     OpenStack overview
     Networking in OpenStack
     Trying out OpenStack
   OpenDaylight
     OpenDaylight programming overview
     OpenDaylight example
   Summary

13. Hybrid SDN
   Preparing the network
     Familiarize yourself with the existing framework and tools
     Network standardization
     Create minimum viable products
     Relentlessly experiment
   Greenfield deployment
   Controller redundancy
     Multiple controller example
   BGP migration example
     Migration segmentation
     VIrl and Mininet setup
     Cisco device configuration
     Ryu BGP speaker
     Mininet and REST Router
     Result and verification
   More BGP example
     Examine the JSONRPC over WebSocket
   Monitoring integration
   Secure TLS connection
   Physical switch selection
     Lab OpenFlow switches
     Incumbent vendor switches
     Whitebox Switches
   Summary
